1. Introduction

1.1 Purpose

This SRS describes the software functional and nonfunctional requirements for release 1.0 of the PatientNow System. This document is intended to be used by the members of the project team that will implement and verify the correct functioning of the system.

The development team conducted client interviews and independent research to gather the information compiled in this document. The purpose of our software requirements specification is to form the basis to guide further planning and implementation of the project. The paper is the first revision of the document.

1.2 Document Conventions

The team has organized the document into five major sections, plus the appendices. Each section may itself be comprised of smaller subsections. The main headings and three appendices appear in boldface 18-point font. Subheadings appear in boldface 14-point font. Subsequent sections (minor subheadings) appear in boldface 12-point font. Hierarchical numbering is used to label all requirements. Examples of the different heading font styles follow:

1. Main Heading

1.1 Subheading

1.1.1 Minor subheading

Section 4 (System Features) utilizes use cases to describe the system's major services. Each use case contains a description of the interactive steps an external actor performs along with the system to achieve a major task. Section 4 provides a more detailed outline of the use case format.

1.3 Intended Audience and Reading Suggestions

Antebellum has prepared this document for use by the medical office service firm and by developers who are implementing or will be modifying the system.

The client and developers of this system should read this entire document thoroughly. However, if a quick overview is needed, please refer to **Section 2: Overall Description**. This section provides a broad high-level overview of the Web Advising system.

For members of the medical office service firm, **Section 4: System Features** would be the primary focus of their reading. This section covers the different tasks that will be possible on the system, as well as how the doctors, administrative assistants, and patients will be able to interact with the system.

This document is the primary guideline for the requirements of the proposed system. Every thorough reading of this document helps create a better product. Any issues, concerns, or errors can be brought to the attention of Antebellum.

1.4 Product Scope

Please refer to the Vision and Scope document; section Scope and Limitations.

1.5 References

The references listed below were used to help create this document.

2. Overall Description

2.1 Product Perspective

Medical offices currently have a disjointed solutions to a couple of problems including scheduling and sharing care plans with their patients. Patients are forced to keep track of their care plans themselves. This forces patients to be unable to review their medical records unless they request a copy. The main goal of this is to provide one unified piece of software for both scheduling appointments and viewing past medical records and care plans.

As we understand, the current solution is problematic due to it segregated, individual systems of scheduling and care plan management. In addition the current solution lacks efficient ways of communicating medical records and recommendations with the patient out of the office.

The proposed application would replace the existing system for scheduling while extending the existing medical record system to allow sharing of selected files. This would allow practices to increase their patient satisfaction and therefore increase adoption of this software.

2.2 Product Functions

This section provides an outline of the functionality needed to meet the needs of all the anticipated user classes as defined in section 2.3.

The major features of the Patient Care Plan and Scheduling software will include:

- Medical Professionals and administrative staff will be able to schedule appointments, this includes rooms and medical professionals needed
- Patients will be able to schedule basic appointments during hours dedicated to those general appointments.

- Medical Professionals will be able to view and edit patient care plans including sharing select medical records with the patient in a secure fashion.
- Medical Professionals and administrative staff can add patients to the system.
- Patients will be able to see up to date care plans and scheduled appointments without leaving our application
- Patients will be able to see their bill and access the payment system from our application, however we will not process payments

For a high-level picture of the groups required for these major requirements, refer to the following diagrams in Appendix B:

- DFD Level 0
- DFD Level 1

2.3 User Classes and Characteristics

During the design of this system we identified the following user classes, they are described in depth below:

- Patients
- Administrative Assistants
- Medical Professionals

2.3.1 Patient

This system is designed to allow patients access to their care plan and schedule. Patients will generally use this as a convenient collection of information and a way of scheduling basic appointments. The system will also generally help patients keep track of their medical professionals current recommendations for care and records that the doctor has shared with the patient

2.3.2 Administrative Assistant

Like for the Patients this system is designed to consolidate important information, and the entering of said information. This system will make it easier for Administrative assistants to edit schedules and bill patients. The Administrative assistants however will not be allowed to access any information shared between the patient and the Medical Professional. That information is not necessary for the Administrative Assistant to perform their job and is therefore protected by HIPPA.

2.3.3 Medical Professional

Medical Professionals will be able to perform all of the actions allowed to an administrative assistant for the event that in smaller practices they are required to perform those responsibilities. In addition the system will allow them to share information with the patient via the patient's care plan and associated medical records. The system will also allow the Medical professional to set their available hours.

2.4 Operating Environment

Our system will operate on the medical offices own servers and will be accessed by patients via a modern web browser such as Chrome or firefox. This website will only be accessible via SSL/TLS (Secure Sockets Layer/Transport Layer Security) to avoid medical records being transmitted over unsecure connections. This system will need a secure link to the existing medical record system to allow for sharing of medical records with patients. The care plans need to be stored in a new database separate from the existing medical record database.

2.5 Design and Implementation Constraints

The following constraints will define the system's implementation.

- Users must be using a browser that supports SSL to access the website due to security concerns
- The practice must have a constant outward facing IP and concurrent users are limited by the practices bandwidth

2.6 Assumptions and Dependencies

We are assuming the that each practice is able to host an external facing website. This includes the cost of a static IP and server upkeep. We are also assuming that the current Medical record system has existing credential protection and also an accessible interface.

3. External Interface Requirements

3.1 User Interfaces

<Describe the logical characteristics of each interface between the software product and the users. This may include sample screen images, any GUI standards or product family style guides that are to be followed, screen layout constraints, standard buttons and functions (e.g., help) that will appear on every screen, keyboard shortcuts, error message display standards, and so on. Define the software components for which a user interface is needed. Details of the user interface design should be documented in a separate user interface specification.>

3.2 Hardware Interfaces

<Describe the logical and physical characteristics of each interface between the software product and the hardware components of the system. This may include the supported device types, the nature of the data and control interactions between the software and the hardware, and communication protocols to be used.>

3.3 Software Interfaces

<Describe the connections between this product and other specific software components (name and version), including databases, operating systems, tools, libraries, and integrated commercial components. Identify the data items or messages coming into the system and going out and describe the purpose of each. Describe the services needed and the nature of communications. Refer to documents that describe detailed application programming interface protocols. Identify data that will be shared across software components. If the data sharing mechanism must be implemented in a specific way (for example, use of a global data area in a multitasking operating system), specify this as an implementation constraint.>

3.4 Communications Interfaces

<Describe the requirements associated with any communications functions required by this product, including e-mail, web browser, network server communications protocols, electronic forms, and so on. Define any pertinent message formatting. Identify any communication standards that will be used, such as FTP or HTTP. Specify any communication security or encryption issues, data transfer rates, and synchronization mechanisms.>

4. System Features

At a high level, the system is limited to a small number of main features--these features can be used by three different groups of users. More specifically, features are available to users in a cascading style, so that the most 'powerful' user has access to all features of the system, while each level of sub-user is limited to a smaller subset of features. In order to illustrate this concept, we have constructed a chart, which follows this text. Each user group is privy to all features at or below its level in the chart:

USER	FEATURE
Medical Professional (Doctor, Dentist, etc.)	Upload medical documents/ care plan
Administrative Assistant	Schedule/cancel non-routine appointment Upload bill invoice Modify availability of rooms/medical professionals
Patient	Schedule/cancel routine appointment View schedule View bill View care plan/ medical documents

As shown above, medical professionals are capable of interacting with all features in the chart, while patients are limited to modifying routine appointments and viewing documents.

4.0.1 General User Interaction with Application

In order to access this application, all user groups will log into the website associated with their medical practice. As such, the application will be served up by a web browser, and all actions will be performed by interacting with the website GUI. Given that different users have varying levels of access, certain features will be hidden from certain users (for instance, patients will not be able to schedule non-routine appointments).

4.0.2 Format of System Features

For clarity, we have outlined high-level features as use cases below. These use cases describe how users interact with the system. Accompanying these use cases are sequence diagrams, which represent interactions with the system as function calls--sequence diagrams can be found in Appendix B.

We standardized our use cases with the following convention:

ID and Name

Modification Information

Description of Feature/Actor

Pre/Postconditions

Feature prominence

Steps that occur throughout feature (including all routes and exceptions)

Information that may affect which steps occur

4.1 Level 0 Use Cases (All users, including patients, have access to)

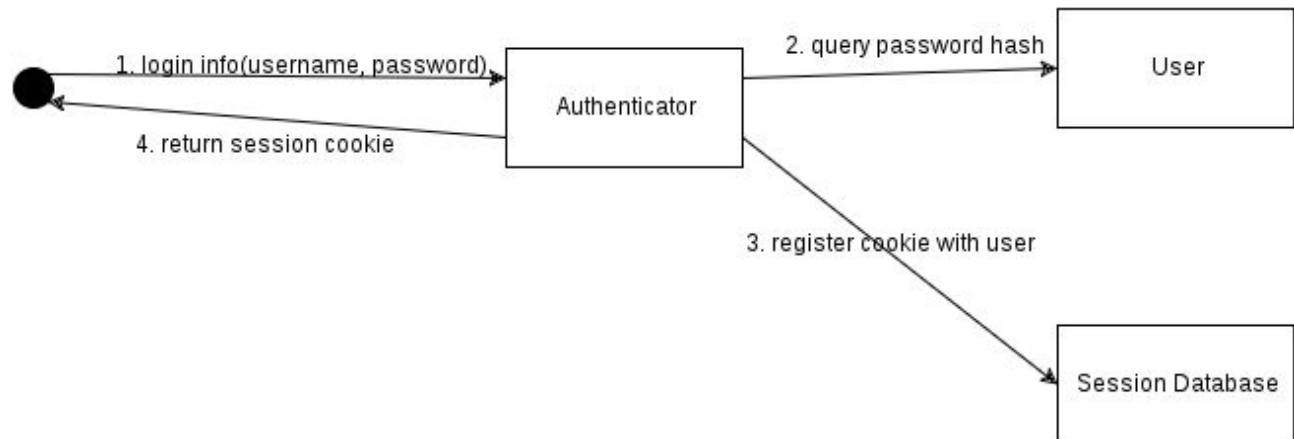

Use Case ID	UC - 1
Use Case Name	Patient Account Registration
Created By Last Updated By	David McIntyre
Date Created Date Last Updated	10/14/16
Actor	Patient
Description	Allows a patient to register for the practice's website
Preconditions	1. User is not logged in
Postconditions	1. User is a registered member of the practice's website

Priority	Medium
Frequency of Use	Low
Normal Course	1.0 Basic Registration <div style="display: flex; justify-content: space-between;"> <div style="width: 45%;"> <p style="text-align: center;"><u>Actor Actions</u></p> <ol style="list-style-type: none"> 1. Patient clicks 'register as patient' 3. Patient enters personal information into the registration form and hits submit 6. User clicks link in confirmation email </div> <div style="width: 45%;"> <p style="text-align: center;"><u>System Responses</u></p> <ol style="list-style-type: none"> 2. System redirects user to the patient registration form 4. System checks form for appropriate data (repeat steps 3 & 4 until form is correctly filled) 5. System redirects user to a page asking them to confirm their email 6. System redirects user to registration confirmation page </div> </div>

5. Other Nonfunctional Requirements

This section contains a list of qualities and requirements the proposed system shall embody and adhere to.

5.1 Performance Requirements

<If there are performance requirements for the product under various circumstances, state them here and explain their rationale, to help the developers understand the intent and make suitable design choices. Specify the timing relationships for real time systems. Make such requirements as specific as possible. You may need to state performance requirements for individual functional requirements or features.>

Minimum Usability Requirements

End User (Patient, Medical Doctor, Administrative Assistant)

- Access to a PC with internet connection.
- Must be able to run a modern web browser (Chrome, Firefox, Safari, Edge)

System Server

- Unix based
- 900 MHz quad core CPU
- 256 MB memory
- Java 1.8 JRE
- Servlet engine
- Web server (Apache)

Since our product is a web based solution, users will need access to a computer with a modern web browser installed. End users that meet these requirements will have access to all of the sites features.

5.2 Safety Requirements

<Specify those requirements that are concerned with possible loss, damage, or harm that could result from the use of the product. Define any safeguards or actions that must be taken, as well as actions that must be prevented. Refer to any external policies or regulations that state safety

issues that affect the product's design or use. Define any safety certifications that must be satisfied.>

PatientNow does not perform any tasks that could directly threaten personal safety or property. In addition PatientNow aims to be fully compliant with ADA dyslexia accommodation guidelines.

5.3 Security Requirements

<Specify any requirements regarding security or privacy issues surrounding use of the product or protection of the data used or created by the product. Define any user identity authentication requirements. Refer to any external policies or regulations containing security issues that affect the product. Define any security or privacy certifications that must be satisfied.>

Due to the sensitive nature of the information we are distributing, our team has come up with a set of guidelines that aims to ensure that the visibility of patient data is achieved by policy. Since our website deals with medical information we also take into account required HIPAA guidelines, which requires there be no 'Admin' (not to be confused with Administrative Assistant) level users.

5.3.1 General

In general all connections to the website are required to use HTTPS. The requirement of modern browsers use also improves the security of our end users. As mentioned before there will not be anyone that has the power to access unauthorized content, including the engineers working with the system.

5.3.2 Patients

All patients are required to enter their username and password before they can have access to their scheduling and medical data. Users can only change their passwords when they are signed in or if they request a 'reset password' and open an email from the website.

5.3.3 Administrative Assistants

Administrative assistants have the permissions to change any patients or doctors schedules and view patient care plans. These users will also log into the site with a username and password. The accounts are created with access codes granted by the Doctors.

5.3.4 Doctors

Doctors will have access to all of the practice's patient care plans and authorized medical records. Since their accounts have the most privileges, they will be required to maintain strong passwords that are replaced every six of months. In order to create a doctor level account a doctor must first verify that he/she is a Medical Doctor with official documentation before they are granted an access code.

5.4 Software Quality Attributes

<Specify any additional quality characteristics for the product that will be important to either the customers or the developers. Some to consider are: adaptability, availability, correctness, flexibility, interoperability, maintainability, portability, reliability, reusability, robustness, testability, and usability. Write these to be specific, quantitative, and verifiable when possible. At the least, clarify the relative preferences for various attributes, such as ease of use over ease of learning.>

5.4.1 Attributes Important to Users

Availability

It's important that our users are able to access our site so that regular dealings at the medical practice can go smoothly rare or nonexistent problems. The site's usage does not have any specific peak hours, meaning that the load will be spread out throughout mainly daylight hours. All site maintenance including updates is to be done at night when most users are expected to be sleeping. With best practices in place the site should be able to maintain 99% uptime.

Reliability

The site will deliver the users content free of bugs or errors. The scheduling component of the software should notify people when things change, and schedules should not disappear or change times due to errors.

Usability

The site's user interface should be understandable and easy to look at. The menu layout will be intuitive to navigate and performing various tasks should take the smallest amount of time as possible.

5.4.1 Attributes Important to Developers

Maintainability

This pertains both to the customers, along with ongoing maintenance of the product down the line. As far as maintenance the entire product will use modern software engineering paradigms like continuous integration and sufficient test coverage. The code itself should be well thought out and use SOLID design principles. As far as updates to our clients (since our product is a self hosted service) updates should be painless and complete within a couple of hours.

5.5 Business Rules

This site must comply with all guidelines specified by both the ADA and the HIPAA. This includes limiting access to medical documents from administrative assistants.

6. Other Requirements

<Define any other requirements not covered elsewhere in the SRS. This might include database requirements, internationalization requirements, legal requirements, reuse objectives for the project, and so on. Add any new sections that are pertinent to the project.>

Appendix A: Data Dictionary

Name	Account Info
Representation	Email Address, Password, Name, Address, Phone Numbers
